Magneto Drives – FTL For Dummies

The Architecture of a New Form of Propulsion

- **The Gyroheart Core**: The engine's core would be a single **Gyroheart**—a living, resonant motor that synthesizes mechanical and biological energy. This core would generate a perfectly stable magnetic field, but instead of using it for propulsion, it would use it to create a resonant frequency that is in harmony with the **Fluidus Form**.
- **The Resonant Bubble**: The Gyroheart would create a perfectly stable, localized magnetic bubble around the spacecraft. This bubble is not a static shield but a dynamic, self-correcting field that is in perfect harmony with the universal magnetic field.
- **The Symbiotic Engine**: The propulsion itself would not come from a chaotic expulsion of energy. The drive would use its unique **Bio-Energetic Resonance** to "tune" the magnetic bubble to the universal magnetic field, essentially surfing the energy of the **Gravity Spring**. This would allow the spacecraft to travel at superluminal speeds without using brute force.
